- In section 4.1 it's written : QLC connected directly to NVMe as a criteria.
  Could we propose a solution where the disks are true native NVMe disks, connected directly to the IO modules of the expansion bay, which simply passes NVMe IOs over the 100Gb links in NVMe over IP mode, without passing through any SAS or SATA subcontrollers ?

    o *Yes you can propose this option*

- Is it possible to propose different alternatives / two different solutions?

    o *Yes, it is possible to propose two solutions but we recommend in this case to be very precise and to add a tab in the price excel file, one tab per solution. We need to be able to easily compare the offers*
